1. General information

The programmable logic valve control of type PLVC 41 is a complete PLC with integrated amplifiers for mobile and stationary hydraulic applications.

The wide range of possible application includes, among others:

- Cranes, crane systems
- Construction machines
- Complex hoisting equipment
- Logging equipment
- Hydraulic clamping systems for machine tools
- Presses

The various control tasks are realized through:

- Modular system with extension and supplementary modules
  - Basic module
  - Extension module (additional inputs/outputs)
  - Extension possibilities via CAN-Bus
- Flexible programming according to IEC 61131-3 standard
  (PLC-programming via instruction list (IL), function block diagram (FBD), or structured text (ST))
- Free parameterization of all outputs, as well as complete diagnosis capability and short-circuit protection
- Remote diagnosis via modem or mobile phone
- Combination of multiple PLVC’s via CAN-Bus within one integrated unit for the control of complex systems

The main performance parameters include furthermore:

- Basic module type PLVC 41, PLVC 41/4
  - 4 analog inputs (for joysticks, potentiometers, sensors, such as analog pressure sensors)
  - 3 digital inputs (for limit switches, pressure switches, push buttons etc.)
  - 3 frequency inputs (for rotary sensors, speed sensors, incremental encoder etc.)
  - Emergency-Stop (opto-decoupled)
  - Interface for RS232 and CAN-Bus
  - 4 outputs for prop. or ON/OFF valves (current-controlled), 8 outputs with type PLVC 41/4
    - 1 output 0...10 V DC, 100 mA
    - 1 auxiliary voltage supply 5 V DC (voltage monitored), max. 150 mA (for supply of joystick, potentiometer etc.)
  - 3 relay outputs (NO-contact) max. 5 A, omitted with type PLVC 4/4
  - Power supply 10...30 V DC, max. 8 A
  - OFF delay
- Extension module type PWM
  - 8 analog inputs (for joysticks, potentiometers, sensors such as analog pressure sensor)
  - 8 digital inputs (for limit switches, pressure switches, push buttons etc.)
  - 8 PWM - output for prop. or ON/OFF valves
  - 8 outputs for lights or LED, max. 1 A, switching to GND
  - Power supply 10 ... 30 V DC, max. 16 A
- Extension module type IPWM
  - 8 analog inputs (for joystick, potentiometer, sensors such as analog pressure sensor)
  - 8 digital inputs (for limit switches, pressure switches, push buttons etc.)
  - 8 outputs for prop. or ON/OFF valves (current-controlled)
  - Power supply 10 ... 30 V DC, max. 16 A
- Extension module type POW
  - 8 analog inputs (for joysticks, potentiometers, sensors such as analog pressure sensor)
  - 8 digital inputs (for limit switches, pressure switches, push buttons etc.)
  - 8 relay outputs (6x change-over contact, 2x NO-contact) max. 15 A
  - 8 outputs for lights or LED, max. 100 mA, switching to GND
  - Power supply 10 ... 30 V DC, max. 5 A

A maximum of 3 extension modules can be connected to the basic module, with a maximum of two extension modules of the same type being employed at the same time.

- Functional software features
  - PLC-programming via instruction list structured text (ST)
  - Parameterization during runtime
  - CAN-Bus integrated in the firmware

- **Firmware**: OS/EN - English
- **Analog inputs**: V - 0 ... 10 V DC, J - 0 ... 5 V DC, A - 4 ... 20 mA

**Note on the specification of analog inputs:**
All analog inputs are delivered with the default assignment 0...10 V DC (coding V).
Differing specification can be specified in the coding, e.g. coding A = 4...20 mA or coding J = 0...5 V DC.

**General data**

- **Casing, protection class**: IP 20 acc. to IEC 60529
- **Temperature range**: -40°C to +80°C
- **Power supply**: 10 V DC to 30 V DC
- **Max. total current**: Basic module: 8 A, IPWM, PWM: 16 A, POW: 5 A
- **Required external fusing**: Basic module: 8 A, (slow blow), IPWM, PWM: 16 A, (slow blow), POW: 5 A, (slow blow)
- **Protection**: Reverse polarity protection gegen Load-Dump (DIN 40839), Shockproof (vibration: IEC 68-2-6, shock: IEC 68-2-27), EMV (EN 61000-6-4, EN 61000-6-1, EN 61000-6-2, EN 61000-6-3)
- **Service life relay**: PLVC 41 (basic module) - resistive load 100000 cycles at 5 A/30 V DC, 300000 cycles at 2 A/30 V DC - inductive load 100000 cycles at 2 A/30 V DC, 300000 cycles at 1 A/30 V DC
- **Monitoring**: PLVC 41 - POW 100000 cycles at 20 A/14 V DC
- **Cable connections**: In-/ Outputs: by means of spring-cage connector Co. PHOENIX type FK-MCP, pitch 3.5 mm max. 8 A, Power supply: Blade type terminals 6.3 mm, Relay outputs: MOLEX Mini Fit Junior 12-pin (part No. 3901 2120)
- **Micro-controller**: ST10F269, 16 bit
- **Basic parameter memory**: EEPROM 1000 words
- **Memory**: Flash: 830 kByte, RAM: 188 kByte
- **Accessories**: Software
- **Mounting**: 6 x M3
- **Casing material**: Stainless-steel
- **Mass (weight)**: approx. 0.5 kg (basic module), approx. 0.25 kg (extension module)
1. Note regarding type PLVC 41/4:

If Prop outputs PWM out 0 and PWM out 1 are used for a twin solenoid (e.g. for type PSL and/or PSV), the measurement input can be used for another twin solenoid at PWM out 4 and PWM out 5. The same applies for the outputs PWM out 2 and PWM out 3. The three relay outputs Rel out 1 (2, 3) are omitted.

2. Note regarding type PLVC 4 E:

Type PLVC 4 E is prepared for use with cut-off delay. The voltage supply for the PLVC is via an additional, permanent source (e.g. car battery) connected at relay terminal 3. This enables a cut-off delay during which operational data can be saved on the EPROM or final operations can be performed even when the switchable power supply is already cut-off. The delay period can be set without time restrictions.

Attention: PLVC 4 E offers one relay output and one digital input less. ("digital in 0").

Relays out 1 to 3 are dropped with type PLVC 41/4 instead there are PWM out 4 to 6

### 2.2 Extension module PWM, IPWM and POW

Order examples:

- **PLVC 41**
  - X /VVVV Basic module acc. to sect. 2.1 with two extensions
  - IPWM /AAAA
  - PWM /AAJJ OS/EN

- **PLVC 41/4**
  - X /VVAA Basic module with one extension
  - POW /VVVJJJJ OS/EN

### General data

- **Supply voltage**: 10 to 30 V DC
- **Max. total current**: POW: 5 A IPWM, PWM: 16 A
- **Required external fusing**: 5 A or 16 A, (slow blow)
- **All other data**: see sect. 2.1
- **Mounting**: with 4 screws onto the basic module

### Note:

A maximum of 3 extension modules can be connected to the basic module with a maximum of two extension modules of the same type being employed at the same time. (Exception: POW only one)

Maximally 16 current-controlled outputs are available (basic module plus extension module X-IPWM). When employing two extension modules X-IPWM, the 4 outputs of the basic module will be deactivated.

Restriction type PLVC 41/4: The basic module type PLVC 41/4 cannot be equipped with two extension module IPWM or PWM.
All inputs and outputs are shown in the block diagram.

3. Software, programming, diagnosis

3.1 Software

The scope of delivery includes the following software package as standard:

- Firmware ("C"-programmed real-time operating system) with integrated CAN functionality as well as PLC-capability
- Functionality of prop. amplifier outputs
- Initializing functions for all inputs and outputs
- Diagnosis software

Available as additional options:

- Diagnosis for CAN-Bus (incl. continuous chart logger)
- Function module, adapted for specified applications (on request)

Examples:
- Load sensing control
- Synchronicity / Positioning
- Position control (e.g. via option W with prop. directional spool valves type PSL(V) acc. to D 7700 ++)
- Flow control (e.g. via prop. flow control valves type SE and SEH acc. to D 7557/1)
- Pressure control (e.g. prop. pressure limiting valve type PMV acc. to D 7485/1 and electrical pressure transducer type DT 1 acc. to D 5440 T and / or type DT 2 acc. to D 5440 T/1)

3.2 Configuration software „PLVC Visual tool“

a) Standard version

The Windows based software „PLVC Visual tool“ (availably free of charge) for configuration and supervision of controller type PLVC. This software provides the following functionality:

- Supervision and configuration of all in- and outputs of the control
- Generation of projects for each control
- Freely selectable nomenclature of all in- and outputs
- Export of the layout in various formats (PDF, Excel)
- Loading and saving of program and parameters
- Transfer of a new firmware
- Update via Internet

b) Extended version

In addition to the standard version of this software there is also an extended version available (not free of charge). This version contains an integrated oscilloscope. The oscilloscope has the following functionality:

- Monitoring of up to 20 signals (in- and outputs as well as internal variable values from the running control program)
- storage period up to 24 h
- Graphics/scope export of the stored files as Bitmap, JPEG, GIF, Postscript, PDF, PCX, SVG
- Export of the indiv. values as text, HTML, XML or Excel
- Import of saved data
- Automatic scaling
- Legend either displayed or masked
- Displayed statistics

3.3 Programming environment OpenPCS

The controller type PLVC can be freely programmed conforming IEC 61131-3 (best with structured text (ST)). Basically, the customer can program his control himself. The software OpenPCS, available from HAWE Hydraulik, is required for programming. Additionally to the user interface there are also manufacturer specific function blocs e.g. controls for prop. outputs, input of frequencies available from HAWE Hydraulik.

Additionally HAWE Hydraulik offers customer oriented programming tutorials.

3.4 Diagnose

The following output equipment can be used for diagnosis:

- PC - connected to interface CAN-Bus or RS232, for parameterization, programming, error detection as well as remote diagnosis via modem.
- CAN-HMI display (see D 7845 HMI), connected via CAN-Bus, for error detection and adjustment parameterization
- VT-software, this software tool enables the diagnosis and parameterization of the PLVC. (see sec. 3.2).
3.5 Function blocks

General:
The manufacturer-specific function blocks serve to indicate to the PLC-programmer the interfaces to the actual system. They are structured into the following two groups:

Group 1: Initializing functions (INI-functions)

These functions are used for parameterization and/or configuration of the inputs and outputs - normally only once at start-up.

It is also possible to apply this parameterization through the firmware. All these parameters and configurations are included in the system’s EEPROM. Thus they are preset and can be overwritten by the PLC-system.

All settings can alternatively be controlled, adjusted and saved into the EEPROM as well as in a file using the terminal program that is part of the delivery package and/or the VT software. Due to these configurations and parameterizations all data is available at runtime in an already converted and standardized form, which even can include a ramp or debouncing information. This makes it possible to write the data directly onto the outputs without conversion and supplemented with ramp information and/or other time-related information.

Group 2: Functions that are normally invoked cyclically during runtime (runtime module)

These functions are used to read input data, logically link them and to write them onto the outputs.

The documentation of the existing function blocks is included in the software package of the PLVC.

4. Dimensions
Basic and extension module type PLVC 4
5. Safety and installation notes

General information

The scope of delivery for the programmable logic valve control type PLVC includes an firmware and - on special agreement - a customized software. It is the duty of the customer to test the requested functionality of the PLVC as he is responsible for the faultless operation and final application of the PLVC.

Attention: Whenever a PLVC is replaced it is additionally necessary to order the current version of the software including the operation parameter by the manufacturer of the machine. The customer is responsible to take care that the requested functionality and safety of the application program is fulfilled. When local laws make an approval by a notified body (testing or approval organization) necessary the customer has to apply for it.

Liability

This description is integral part of the device. It contains information regarding the correct use of the PLVC and must be read prior to installation or prior to use. Make sure to follow the instructions of this description. Failure to comply with the notes or any operation that falls outside the intended usage, wrong installation or faulty handling can cause serious impairment of the safety of people and machinery and as such will prejudice any liability and warranty claims. This instruction is written for personnel, who can be considered to be “technically knowledgeable” in the understanding of the EMC-guideline 89/336 EEC and the low-voltage guideline 73/23 EEC. The controls must be installed and made operational by a professional electrician (programmer and/or service technician).

5.1 Installation

Electrical connection, grounding, arrangement of the wiring:

- Connect housing with GND (electrical interference protection), select shortest connection between casing and machine (independent of negative terminal and voltage supply)
- Wiring in accordance with safe protective low voltage and/or electrically separated from other electric circuits
- Faulty switching can trigger unintended signals at the outputs of the control device.

Attention: The parallel switching of external voltage sources (e.g. emergency activation via push button) and the outputs of the PLVC is not permitted!

- Pay attention to application-relevant documents (circuit diagrams, software descriptions, etc.).
- Recommended cross sections of the connection lines
  - Power supply, relays: >= 1 mm²
  - Other inputs and outputs: >= 0.5 mm²
- Only use shielded signal lines
- Do not install any wiring for electronic systems close to other power-fed lines in the machine.
- Make sure to use only additional accessory approved by HAWE Hydraulik SE
- A safety switch must be installed to interrupt the power supply of the electronic system to deactivate system in case of emergencies. This safety switch must be installed within easy reach for the operator. If the safety switch is activated the machine must be brought into standstill in a “safe status”. The system’s design must guarantee this feature.

Installation conditions

- It must not be mounted nearby heat generating components or sub-assemblies (exhaust etc.).
- It must not be placed near-by to radio facilities.
- An emergency cut-off has to be provided. This emergency cut-off has to be positioned at the machinery in such a manner that it is easily accessible by the operator. It has to be made sure by the manufacturer of the machinery that it can achieve a save position after the emergency cut-off is activated.
- The control lines must nor be routed nearby power supply lines.
- Line disruption and short-cut detection for the control lines have to be provided.
- The power supply lines (+ and -) for controller with several extensions has to be split-up as near-by to the controller as possible, see illustrations below.

Correct:

```
+/-

Extension 2
Extension 1
Basic control unit
```

Wrong:

```
+/-

Extension 2
Extension 1
Basic control unit
```

- All terminals for the power supply of the controller type PLVC have to be connected always
- All signal lines should be shielded
- Take care that sensors connected are properly grounded.
5.2 Installation, operation and maintenance

- Make sure to stay within the temperature range for operations between -40°C to +80°C.
- Surfaces may encounter higher temperatures.
- Do not install in the vicinity of machine parts and modules that develop great heat (e.g. exhaust).
- Prior to any welding work to be done on the machine (the vehicle), all PLVC devices must be disconnected from the power supply (positive and negative terminal) and/or a potential separation must be guaranteed.
- Make sure to keep sufficient distance to radio-engineering installations.

Notes on proportional and switching solenoids and other switched inductive consumers:
- Make sure to test the PLVC’s correct function only with connected proportional solenoids.
- Make sure to connect all other switched inductive consumers, which are not connected to the PLVC, close to inductivity with spark arrester diodes.

5.3 Loading of the firmware

Each controller type PLVC comes with the current version of the firmware. It can be updated via Windows ® based computer according to customer specifications or with additional functionality.

5.3.1 Firmware is working

A new firmware can be installed over the operative one. All functionality needed for such an upload is integrated in the current firmware. Connect the controller type PLVC and PC via the serial interface and start the respective upload program of the firmware.

5.3.2 Firmware is not working

A new firmware can be installed, even when the apparent firmware won’t start-up (e.g. after discontinued upload of an firmware). Therefore a special mode has to be activated.

Connect the controls via the serial interface (RS232) with a PC.

Procedure:
- Cut-off the controller.
- Bridge the two pins beneath the terminal rail X1 (see pict.) e.g. small screw driver.
- Switch-on the controller, while both pins are short-cut. The LEDs on the side must be off.
- Start download of the firmware.

![Image of controller with pins labeled](image-url)
5.4 Mechanical installation
5.4.1 Mounting
For dimensions, see sect. 4, mounting with 6x screws M3
The connection hole pattern is illustrated in the drawing below

5.4.2 Power supply
Power supply via two blade type terminals 6.3 mm.

5.4.3 Spring-cage connectors
No wire end sleeve should be used when connecting the individual lines to the terminal rail of the PLVC.

Best tear-out resistance is achieved, when the line end (insulation removed) is inserted into the spring-cage.

Without sleeve the spring will bend the line end for additional strength - slightly tear at the line to ensure proper installation.
The pictures below show the proper working sequence.

5.4.4 Relay contacts
The relay terminals are connected via plug MOLEX Mini Fit Junior 12-pin.

Illustration: Relay terminals at basic unit of type PLVC 41. For pin circuitry at X3, see sec. 7

Note:
A clamp diode is required in case of inductive loads.

5.4.5 Wiring loom adapter PLVC 4 to PLVC 41
This adapter enables the connection of a PLVC 41 (connector X3) to a wiring loom intended for PLVC 4 (connector X3).

The adapter is completely assembled and consists of:
1 x Connector housing 12-way Co. MOLEX
9 x Crimp contact AWG16
9 x Blade terminal 6.3x0.8 red
9 x Insulation jacket Co. ETTLINGER No. 12.99.611
9 x Wire 0.5 qmm black insulation H05V-K 20 cm

5.5 Components of the control system
5.5.1 Communication

a) Serial interface (RS232)
The basic module PLVC 41 features a serial interface.
It is positioned at terminal rail X1 Pins 1, 2 and 3:
Serial interface PLVC 41 – Pins 1, 2 and 3

Functionality via the serial interface:
- Monitoring current signals from the PLVC
- Setting adjustment for prop. outputs and analog inputs
- Creation of measurement plots (oscilloscope of the Visual Tool)

A second serial interface for application related tasks is at terminal rail X3 (X 3.7, X 3.8, and X 3.10)
The PLVC is connected via a standard serial 9-pin interface line and the respective adapter to the PC.
The adapter can easily be self-made.
Take a 9-pin D-sub-socket, solder Pin 2 to RX, 3 to TX and 5 to GND. These lines are connected later to terminal rail X1.
The transfer rate can be set between 9600 and 57000 kBaud.

Adapter for serial interface

</tr>
<tr>
<td>X1.3</td>
<td>5</td>
</tr>
</tbody>
</table>
b) CAN-Bus
CAN-bus (Controller Area Network) is a asynchrone, serial bus system, where only two lines are required. Twisted-Pair-lines with a wave resistance of 108…132 Ohm are recommended acc. to ISO 11898-2 (High-Speed Medium Access Unit). The max. (theoretical) line length is e.g., 40 m for 1 Mbit/s, 100 m for 500 kbit/s or 500 m for 125 kbit/s.
The basic module of PLVC 41 features a CAN port, where additional controller type PLVC 41 or PLVC 21 with may be connected. CAN-bus sensors (CanOpen-standard) can be also connected to PLVC 41.
The CAN-bus interface supports protocols CanOpen and J1939.

CAN-Bus baud rate
The transfer rate via CAN-bus can be set to following rates:
- 50 kBaud
- 100 kBaud
- 125 kBaud
- 250 kBaud
- 500 kBaud
- 1000 kBaud

CAN-bus termination
Two terminal resistors of 120 Ohm (between CAN_HIGH and CAN_LOW) must be positioned at the lead ends of the bus lines and there only.
These terminal resistors are integrated at the PLVC 41. They can be activated when the is a connection between X1.29 (CAN low) and X1.30, in case the PLVC is the final unit of a CAN-network.

5.5.2 Outputs

a) Proportional solenoids
- Other consumers switched-on and –off, which are not connected to the PLVC must be provided with clamp diodes nearby the source of inductivity
- The outputs of the extensions IPWM-, and PWM feature integrated free-wheeling diodes.

Proportional outputs of extension IPWM
The extension IPWM provides current controlled PWM-outputs, i.e. the set current is maintained via return current measurement no matter whether the resistance of the coil fluctuates due to temperature changes.
PWM frequency is 1 kHz. The pulse ratio can be set between 5% and 94%. Both, dither frequency (on and off frequency) and dither amplitude can be adjusted as well.

Proportional outputs of extension PWM
The extension PWM provides PWM-outputs with out current control.
The dither frequency can be switched between 50 Hz and 100 Hz.
The pulse ratio can be set between 5% and 100% within 5% steps. It controls the voltage to monitor short cuts.

b) Relay
The basic module of PLVC 41-G features three potential-free relays. The relays switch contacts X3.1/X3.2, X 3.3/X3.4, X3.5/X3.6
The maximum switchable current is 5 A.
It is strongly recommended to fuse every single relay separately.
It is to avoid the switch-on of inductive loads because of short-term high currents which could cause damages at the relays (welded) or at the PLVC-conductor board.

c) 5 V DC-output
The basic module of PLVC 41 features a stabilized 5V DC-output at contact X1.17.
The maximum load is limited to 150 mA. A the higher the temperature at the PLVC 41 and the higher the actual load at the output are, the lower the actual output voltage will be.
Sensors and joysticks with a 5 V DC-supply voltage could be connected.
The output is monitored internally. Changes at the output voltage could be compensated by the control, by means enabling a stable sensor signal.

d) 10 V DC-output
A programmable control power supply (10 V DC) can be picked-up at terminal X1.18.
The maximum current is limited to 100 mA.
The output is programmable via the OpenPCS-software.
5.5.3 Inputs

a) Emergency-stop input
There is an emergency-stop input at terminal X1.23 of the basic PLVC 41, which has to be fed with 10-30 V to ensure that the valve ports are energized.

It is standard set-up of the controller, that the controller has to be rebooted after the emergency-stop had been activated. The PLVC 41 has to be switched-off and subsequently switched-on after the emergency actuation had been actuated.

This behavior can be changed by resetting a parameter, that the controller will activate the valves immediately after the emergency stop port is energized again.

b) Analog sensors
All kind of sensors, which generate a output signal of 0-5 V, 0-10 V or 4-20 mA, can be connected to the PLVC.

The respective configuration of the analog inputs at the PLVC have to be specified in your order.

The power supply for analog sensors has to be properly grounded i.e. all via the PLVC, otherwise the sensor signal will be influenced. The power supply for the machinery must not drop below the power supply specification of the sensor – 12 V DC systems are prone for this.

All lines should be shielded twisted pair cables.

The different configurations of the analog inputs have the following input impedances:

<table>
<thead>
<tr>
<th>Input type</th>
<th>Impedance</th>
</tr>
</thead>
<tbody>
<tr>
<td>0-5 V</td>
<td>330 kOhm</td>
</tr>
<tr>
<td>0-10 V</td>
<td>94 kOhm</td>
</tr>
<tr>
<td>4-20 mA</td>
<td>220 Ohm</td>
</tr>
</tbody>
</table>

Ground connection for the sensors
WRONG: “+” connected at the PLVC, but “-” is connected to the battery directly
CORRECT: “+” and “-” are directly connected at the PLVC.

Wrong ground connection for the sensor

Comparison between 0-10 V and 4-20 mA
Basically, sensors with an output signal of 0-10 V or 4-20 mA can be used.
Both kind of sensors offer various pro’s and con’s, see table below.

<table>
<thead>
<tr>
<th>Signal</th>
<th>Advantage</th>
<th>Disadvantage</th>
</tr>
</thead>
<tbody>
<tr>
<td>0-10 V</td>
<td>Measurement in parallel is possible</td>
<td>More prone to failure</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Three lines necessary</td>
</tr>
<tr>
<td>4-20 mA</td>
<td>Failure resistant</td>
<td>Generated voltage drop</td>
</tr>
<tr>
<td></td>
<td>Integrated line disruption detection</td>
<td>Correct input resistors are necessary</td>
</tr>
<tr>
<td></td>
<td>Two lines necessary</td>
<td></td>
</tr>
</tbody>
</table>

c) Joy-sticks
Usually joy-sticks generate a signal even in zero position (e.g. 2.5 V for supply voltage 5 V). This has to be taken in account when setting the parameters. Otherwise there may be undesired movement at the machinery, even when the joy-stick is in zero position.

d) Speed sensor
The basic PLVC unit already supplied three digital inputs, which can be employed for frequency measurements.

The measurable critical frequency is 5 kHz. The signal level must be < 0.8 V (OFF) and > 2.5 V (ON).

e) Digital input signals
The switching threshold of the digital inputs is LOW < 0.8 V, HIGH > 2.5 V.
6. **Troubleshooting**

6.1 **Malfunction detection**

- Display via flash pattern of LEDs (see below)
- The power outputs are supplied by separate connections that are independent of the electronics.
- The firmware will centrally switch off all proportional and switch outputs in case of disturbances in the program sequence.

Error detection is made via the flash pattern of two independent LEDs.

- LED1 for the system
- LED2 for the CAN-Bus and others

**LED1 (System)**

<table>
<thead>
<tr>
<th>Status</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
<td>0</td>
</tr>
<tr>
<td>Slow 2-second period</td>
<td>0</td>
</tr>
<tr>
<td>Medium 1-second period</td>
<td>0</td>
</tr>
<tr>
<td>Quick 0.5-second period</td>
<td>0</td>
</tr>
<tr>
<td>On (permanent)</td>
<td>0</td>
</tr>
</tbody>
</table>

**LED2 (CAN)**

<table>
<thead>
<tr>
<th>Status</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Slow 2-second period</td>
<td>0</td>
</tr>
<tr>
<td>Medium 1-second period</td>
<td>0</td>
</tr>
<tr>
<td>Quick 0.5-second period</td>
<td>0</td>
</tr>
<tr>
<td>On (permanent)</td>
<td>0</td>
</tr>
</tbody>
</table>

**Indicated malfunction**

- Emergency-Stop
- Radio control
- PLC internal error
- Error digital output
- Error analogue input
- Prop. valve open
- Prop. valve shortcut
- System o.k.
- CAN-Bus Off
- CAN-Warning
- Error EEPROM
- Wrong supply voltage
- Error digital input
- No radio signal
- CAN o.k. (and no other errors for LED2)
### 6.2 Failure remedy

The table below lists failure states and shows possible ways for failure remedy. The use of software of VT of HAWE is mandatory:

<table>
<thead>
<tr>
<th>Failure</th>
<th>Reason</th>
<th>Remedy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Controller won’t boot (LEDs are OFF)</td>
<td>No power supply</td>
<td>Check power supply and fuses</td>
</tr>
<tr>
<td></td>
<td>Firmware not completely copied</td>
<td>Reload firmware</td>
</tr>
<tr>
<td></td>
<td>Line disruption at the input line</td>
<td>Replace line</td>
</tr>
<tr>
<td>No Login available</td>
<td>Controller are OFF</td>
<td>Switch-on controller</td>
</tr>
<tr>
<td></td>
<td>Serial interface is wrongly or not connected</td>
<td>Check connection of the serial interface</td>
</tr>
<tr>
<td></td>
<td>Firmware not completely copied</td>
<td>Reload firmware</td>
</tr>
<tr>
<td>Program does not run</td>
<td>Program was stopped via user parameter</td>
<td>User parameter 99 must not be set at 4711</td>
</tr>
<tr>
<td></td>
<td>Program not completely copied</td>
<td>The program name must be visible on the first page after log in via the terminal program</td>
</tr>
<tr>
<td>Input signal (digital/analog) is not recognized</td>
<td>Line is not connected</td>
